

# Max-Heap

**index**

**1 2 3 4 5 6 7 8 9 10**

**value**

16	14	10	8	7	9	3	2	4	1
----	----	----	---	---	---	---	---	---	---

# Heap Properties

- An array  $A$  that represents **heap** is an object with two attributes:
  - $A.length$  (No. of elements in the array)
  - $A.heap-size$  (how many elements in the heap stored)
- Compute indices:
  - Parent ( $i$ ) {  $return (i/2)$  }
  - Left ( $i$ ) {  $return (2i)$  }
  - Right ( $i$ ) {  $return (2i+1)$  }

# Heap Types

- There are two types of binary heap:
  - Max-heaps {  $A[\text{Parent}(i)] \geq A[i]$  }
    - Largest element at the root
  - Min-heaps {  $A[\text{Parent}(i)] \leq A[i]$  }
    - Smallest element at the root

# Maintaining Heap Property

- **MAX\_HEAPIFY** procedure

**Max-Heapify(A,i)**

l=left (i)

r=right (i)

if l <= A.heap-size and A[l]>A[i]

largest = l

else largest = r

if r<= A.heap-size and A[r]>A[largest]

largest = r

if largest <> i

exchange A [i] with A[largest]

Max-Heapify (A, largest)

# Maintaining Heap Property - Example

**Max-Heapify (A, 2)**

**A.heap-size = 10**

**l = 4**

**r = 5**

**4 <= 10 and 14 > 4**

**largest = 4**

**5 <= 10 and 7 > 14**

**Nothing**

**4 <> 2**

**exchange 4 with 14**

**Max-heapify (A, 4)**

# Building a Heap

- BUILD\_MAX\_HEAP procedure (goes half of the nodes and runs Max-Heapify on each one)

## Build-Max-Heap(A)

A.length = A.heap-size

for i = [A.length / 2] down to 1

Max-Heapify (A,i)

\*\*\*\*\*

## Note:

In binary tree we know that **A.length/2** elements from starting are always internal nodes, not leave nodes, so we start our procedure from A.length/2

# Build Heap - Example

index

1 2 3 4 5 6 7 8 9 10

value

4	1	3	2	16	9	10	14	8	7
---	---	---	---	----	---	----	----	---	---

# Build Heap – Example cont.

# Build Heap – Example cont.

# Build Heap – Example cont.

<b>index</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>	<b>8</b>	<b>9</b>	<b>10</b>
<b>value</b>	16	14	10	8	7	9	3	2	4	1

# Heap Sort Algorithm

- HEAPSORT procedure

**HeapSort(A)**

**Build-Max-Heap(A)**

    for  $i = A.length$  down to 2

        exchange  $A[1]$  with  $A[i]$

$A.heap-size = A.heap-size - 1$

        Max-Heapify (A,1)

\*\*\*\*\*

HEAPSORT procedure takes  **$O(n \log n)$**  running time.

Build-Max-Heap procedure takes  **$O(n)$**  running time.

Max-Heapify procedure takes  **$O(\log n)$**  running time.
